## **Instructions:**

- Make sure you are working on your problem set as each problem set is different.
- The answers to the questions of this problem set are to be given exclusively in the answer sheet
- The answers sheet MUST be printed and not photocopied. Photocopies will not be accepted.
- ullet Questions marked with the symbol ullet admit more than one correct answer
- Please fill the boxes in the answer sheet completely using a black pen as follows

Question 1: B C D E

- The answer sheet must not be creased or folded otherwise your problem set won't be graded.
- You can hand back your problem set at the END of class on May 2.

With a sample of 706 observations, we estimate the following model:

$$ln(hwage_i) = \beta_0 + \beta_1 age_i + \beta_2 age_i^2 + \beta_3 educ_i + \beta_4 yngkid_i + u_i$$

and obtain these results:

where *lhwage* is the logarithm of the hourly wage in euro, *age* is measured in years, *educ* is years of education and *yngkid* is a variable equal to 1 in case the person has a child younger than three years.

## **Question 1** What is the interpretation of $\beta_1$ ?

- A By itself does not have a proper interpretation.
- B Increasing age by one year, the hourly wage increases by 7.1% on average, ceteris paribus.
- C Increasing age by one year and keeping its square fixed, the hourly wage increases by 7.1% on average, ceteris paribus.
- D Increasing age by one year, the hourly wage increases by 0.071 euros on average, ceteris paribus.

## **Question 2** What is the interpretation of $\beta_2$ ?

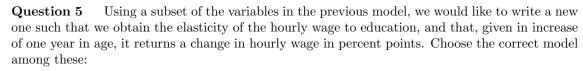

- A Increasing the square of age by one year, the hourly wage decreases by 0.077% on average, ceteris paribus.
- B By itself does not have a proper interpretation.
- C Increasing age by one year, the hourly wage decreases by 0.077% on average, ceteris paribus.
- D Increasing the square of age by one year, the hourly wage decreases by 0.00077 euros on average, ceteris paribus.

## **Question 3** $\clubsuit$ Is $\beta_2$ statistically significant?

- A It is not at 10% level.
- B It is at 5% level.
- C We cannot check for this, it makes no sense.
- D It is not at 1% level.
- E None of these answers are correct.

### **Question 4** $\clubsuit$ Is $\beta_4$ statistically significant?

- A It is at 1% level.
- B It is at 5% level.
- C It is not at 10% level.
- D It is not at 2.5% level.
- E None of these answers are correct.

$$\boxed{\mathbf{B}} \ ln(hwage_i) = \beta_0 + \beta_1 ln(age_i) + \beta_2 educ_i + u_i$$

$$\boxed{C} hwage_i = \beta_0 + \beta_1 age_i + \beta_2 ln(educ_i) + u_i$$

$$\boxed{D} ln(hwage_i) = \beta_0 + \beta_1 age_i + \beta_2 ln(educ_i) + u_i$$

$$\boxed{\text{E}} ln(hwage_i) = \beta_0 + \beta_1 age + ln(\beta_2 educ_i) + u_i$$

**Question 6** Keeping other variables fixed, at what age the logarithm of hourly wage is maximized?

- At about 0, but this makes no sense.
- B At about 56.3 years.
- C At about 93.3 years.
- D At about 46.7 years.

Let us define with Y the amount of cholesterol in mlg in the blood and with Med a dummy variable which takes the value of 1 for medication B and 0 for medication A, where A and B are two different medications that lower cholesterol. Female is a dummy variable which takes the value of 1 for females and 0 otherwise.

Consider the following regression:

$$Y = \beta_0 + \beta_1 \times med + \beta_2 \times female + \beta_3 \times med \times female + u.$$

**Question 7** Suppose you use this model:  $Y = \beta_0 + \beta_1 \times med + \beta_2 \times female + u$  In this case, what is the effect of medication B for man and women, respectively?

- $\boxed{\mathbf{A}}$   $\beta_1$  for both genders.
- B None of the others.
- $\square$   $\beta_1$  and  $\beta_1 + \beta_2$ .
- $D \beta_1 \beta_0$  for both genders.
- E  $\beta_0 + \beta_1$  and  $\beta_0 + \beta_1 + \beta_2$ .

**Question 8** Suppose you use this model:  $Y = \beta_0 + \beta_1 \times med + \beta_2 \times female + u$  What would be the underlying assumption in this case?

- A There are no gender differences in the average cholesterol level.
- B Medication A and B may operate differently between females and males.
- C Males and females choose to take the same medication (either A or B).
- D None of the others.
- [E] Medication A and B do not operate differently between females and males.

#### Question 3

These data are taken from the Medical Expenditure Panel Survey survey conducted in 1996. These data were provided by Professor Harvey Rosen of Princeton University and were used in his paper with Craig Perry "The Self-Employed Are Less Likely Than Wage-Earners to Have Health Insurance. So What?" in Douglas Holtz-Eakin and Harvey S. Rosen, eds., Entrepeneurship and Public Po licy, MIT Press 2004.

Among the variables in the dataset, ins is a dummy equal to one if the interviewee has the insurance; selfemp is equal to one if the interviewee is a self-employed workers; gender is equal to one if the individual is a male; married is one if the individual is married; health is one if the individual reports to be in good health; educ is 0 if the person has no education, 1 if he/she achieved middle school diploma, 2 for the high school diploma, 3 for the bachelor degree, 4 for the master degree and 5 for the PhD; age is in years and age2 is the square of age.

We estimate two models:

$$Pr(ins = 1|X) = \beta_0 + \beta_1 \times selfemp + \beta_2 \times married + \beta_3 \times gender + \beta_4 \times health + \beta_5 \times gender * health + \beta_6 \times educ + \beta_7 \times age + \beta_8 \times age^2$$

#### Coefficients:

|               | Estimate S | Std. Error t | value  | Pr(> t )  |
|---------------|------------|--------------|--------|-----------|
| (Intercept)   | 0.2974634  | 0.0580248    | 5.13   | 0.0000003 |
| selfemp       | -0.1742361 | 0.0141740    | -12.29 | < 2e-16   |
| married       | 0.1181062  | 0.0094187    | 12.54  | < 2e-16   |
| gender        | -0.0232270 | 0.0343575    | -0.68  | 0.49903   |
| health        | 0.0744310  | 0.0247243    | 3.01   | 0.00262   |
| genderxhealth | -0.0206248 | 0.0353131    | -0.58  | 0.55920   |
| educ          | 0.0529807  | 0.0029210    | 18.14  | < 2e-16   |
| age           | 0.0105315  | 0.0027482    | 3.83   | 0.00013   |
| age2          | -0.0000788 | 0.0000333    | -2.37  | 0.01796   |
|               |            |              |        |           |

Heteroskadasticity robust standard errors used

$$Pr(ins = 1|X) = \Phi(\beta_0 + \beta_1 \times selfemp + \beta_2 \times married + \beta_3 \times gender + \beta_4 \times health + \beta_5 \times gender * health + \beta_6 \times educ + \beta_7 \times age + \beta_8 \times age^2)$$
 (II)

#### Coefficients:

|               | Estimate  | Std. Error | ${\tt z}$ value | Pr(> z ) |
|---------------|-----------|------------|-----------------|----------|
| (Intercept)   | -0.844932 | 0.195991   | -4.31           | 0.000016 |
| selfemp       | -0.651923 | 0.046842   | -13.92          | < 2e-16  |
| married       | 0.455241  | 0.034845   | 13.06           | < 2e-16  |
| gender        | -0.040238 | 0.111653   | -0.36           | 0.71856  |
| health        | 0.300503  | 0.082988   | 3.62            | 0.00029  |
| genderxhealth | -0.124880 | 0.116613   | -1.07           | 0.28422  |
| education     | 0.226139  | 0.012852   | 17.60           | < 2e-16  |
| age           | 0.029150  | 0.009899   | 2.94            | 0.00323  |
| age2          | -0.000162 | 0.000126   | -1.29           | 0.19821  |
|               |           |            |                 |          |

Question 9 Is being married significantly linked to having an insurance under model (I)?

- A Yes, since the model includes the variable "married".
- B No, since the coefficient  $\beta_2$  is not significant.
- C It depends on the values of all other covariates.
- $\boxed{\mathrm{D}}$  Yes, since the coefficient  $\beta_2$  is significant.

### **Question 10** What is the interretation of $\beta_6$ in model (I)?

- A Increasing years of education by one, makes the individual 5.3% more likely to have an insurance, holding all other things constant.
- B It does not have a proper interpretation.
- C Increasing years of education by one, on average, makes the individual 5.3% more likely to have an insurance, *ceteris paribus*.
- D Increasing a person's education level by one, on average, makes he/she 5.3% more likely to have an insurance, ceteris paribus.

Question 11 Does increasing level of education have a positive impact on the probability to buy an insurance at 5% level under model (II)?

- A Yes, since the model includes the variable "educ".
- $\boxed{\mathrm{B}}$  Yes, since the t-test on the coefficient  $\beta_6$  is higher than 1.64.
- $\boxed{\mathbf{C}}$  No, since the coefficient  $\beta_6$  is not significant.
- D It depends on the values of all other covariates.

Question 12 Does increasing level of education have a significant impact on the probability to buy an insurance at 5% level under model (II)?

- $\boxed{\mathbf{A}}$  No, since the coefficient  $\beta_6$  is not significant.
- B Yes, since the model includes the variable "educ".
- C It depends on the values of all other covariates.
- D Yes, since the coefficient  $\beta_6$  is significant.

Question 13 . Under model (I), which of the following statements are true?

- A The older an individual grows, the higher the probability of having an insurance.
- B Statistically speaking, having a good health has the same impact on the probability of having an insurance for men and women.
- C The probability of having an insurance is linked to age in a linear fashion.
- D On average, self employed people are less likely to have an insurance, controlling for all other factors.
- E None of these answers are correct.

Question 14 \( \bigcup \) Under model (II), which of the following statements are true?

- A On average, self employment has a negative effect on the probability of having an insurance, ceteris paribus.
- B We cannot possibly know whether education level has an effect on the probability of having an insurance.
- C We cannot interpret directly the estimated coefficients in terms of magnitude.
- D The probability of having an insurance for a married person is, on average, 45.5% higher than for other people, *ceteris paribus*.
- | E | None of these answers are correct.

**Question 15** In model (I) we used heteroskedastic-robust standard errors. Could have we used homoskedastic standard errors instead?

- A No, because the errors are very likely to autocorrelated.
- B No, because homoskedasticity rarely occurs in nature.
- C No, because homoskedasticity is not possible when the dependent variable is a dummy.
- D Only if we knew that the errors were in facts homoskedastic.

Question 16 What is the estimated probability that a 24 years old non-educated non-self-employed single female who is not in good health and with middle school diploma will buy insurance coverage?

- A I cannot say because the model is nonlinear.
- B Less than 5%.
- C Approximately 0.5.
- D More than 95%.
