PROBLEM SET 5 Due back by Tuesday May 2.

Name: MARZOLO GIAN FRANCESCO

Id: 189401

Instructions:

- Make sure you are working on your problem set as each problem set is different.
- The answers to the questions of this problem set are to be given exclusively in the answer sheet
- The answers sheet MUST be printed and not photocopied. Photocopies will not be accepted.
- Questions marked with the symbol admit more than one correct answer
- Please fill the boxes in the answer sheet completely using a black pen as follows

Question 1: B C D E

- The answer sheet must not be creased or folded otherwise your problem set won't be graded.
- You can hand back your problem set at the END of class on May 2.

With a sample of 706 observations, we estimate the following model:

$$ln(hwage_i) = \beta_0 + \beta_1 age_i + \beta_2 age_i^2 + \beta_3 educ_i + \beta_4 yngkid_i + u_i$$

and obtain these results:

where *lhwage* is the logarithm of the hourly wage in euro, *age* is measured in years, *educ* is years of education and *yngkid* is a variable equal to 1 in case the person has a child younger than three years.

Question 1 What is the interpretation of β_2 ?

- A Increasing the square of age by one year, the hourly wage decreases by 0.077% on average, ceteris paribus.
- B Increasing age by one year, the hourly wage decreases by 0.077% on average, ceteris paribus.
- C By itself does not have a proper interpretation.
- D Increasing the square of age by one year, the hourly wage decreases by 0.00077 euros on average, ceteris paribus.

Question 2 What is the interpretation of β_3 ?

- A One year more of education is associated with a change of about 0.07% in hourly wage, on average, ceteris paribus.
- B One year more of education is associated with a change of about 0.0007 in hourly wage, on average, ceteris paribus.
- C An increase of 1% in education is associated with a change of about 0.07 euros in hourly wage, on average, ceteris paribus.
- D One year more of education is associated with a change of about 0.07 euros in hourly wage, on average, ceteris paribus.
- E An increase of 1% in education is associated with a change of about 7% euros in hourly wage, on average, ceteris paribus.
- F One year more of education is associated with a change of about 7% in hourly wage, on average, ceteris paribus.

Question 3 \clubsuit Is β_3 statistically higher than 0.05 at 5%?

- A Yes, it is, since the t-value is smaller than 1.64.
- B No, it is not, since the t-value is smaller than 1.96.
- C Yes, it is, since the t-value is larger than 1.64.
- D No, it is not since the t-value is larger than 1.96.
- E None of these answers are correct.

Question 4 What are we testing when we check whether β_2 is significant?

- A We check whether the logarithm of hourly wage depends positively on age.
- B We check whether the logarithm of hourly wage depends on age.
- C We check whether the logarithm of hourly wage depends linearly on age.
- D We check whether the logarithm of hourly wage depends negatively on age.

- At about 0, but this makes no sense.
- B At about 46.7 years.
- C At about 93.3 years.
- D At about 56.3 years.

Question 6 Using a subset of the variables in the previous model, we would like to write a new one such that we obtain the elasticity of the hourly wage to education, and that, given in increase of one year in age, it returns a change in hourly wage in percent points. Choose the correct model among these:

- $\boxed{A} ln(hwage_i) = \beta_0 + \beta_1 age_i + \beta_2 ln(educ_i) + u_i$
- $\boxed{\mathbf{B}} \ ln(hwage_i) = \beta_0 + \beta_1 age + ln(\beta_2 educ_i) + u_i$
- $\boxed{C} hwage_i = \beta_0 + \beta_1 ln(age_i) + \beta_2 educ_i + u_i$
- $\boxed{E} ln(hwage_i) = \beta_0 + \beta_1 ln(age_i) + \beta_2 educ_i + u_i$

 $\mathbf{2}$

Let us define with Y the amount of cholesterol in mlg in the blood and with Med a dummy variable which takes the value of 1 for medication B and 0 for medication A, where A and B are two different medications that lower cholesterol. Female is a dummy variable which takes the value of 1 for females and 0 otherwise.

Consider the following regression:

$$Y = \beta_0 + \beta_1 \times med + \beta_2 \times female + \beta_3 \times med \times female + u.$$

Question 7 Suppose you use this model: $Y = \beta_0 + \beta_1 \times med + \beta_2 \times female + u$ What would be the underlying assumption in this case?

- A None of the others.
- B There are no gender differences in the average cholesterol level.
- C Males and females choose to take the same medication (either A or B).
- D Medication A and B may operate differently between females and males.
- [E] Medication A and B do not operate differently between females and males.

Question 8 What is the effect of using medication B with respect to medication A for men?

- A β_1 - β_0
- $\boxed{\mathrm{B}} \beta_0$
- C $\beta_0 + \beta_1$
- D None of the others.
- $[E] \beta_1$

These data are taken from the Medical Expenditure Panel Survey survey conducted in 1996. These data were provided by Professor Harvey Rosen of Princeton University and were used in his paper with Craig Perry "The Self-Employed Are Less Likely Than Wage-Earners to Have Health Insurance. So What?" in Douglas Holtz-Eakin and Harvey S. Rosen, eds., Entrepeneurship and Public Po licy, MIT Press 2004.

Among the variables in the dataset, ins is a dummy equal to one if the interviewee has the insurance; selfemp is equal to one if the interviewee is a self-employed workers; gender is equal to one if the individual is a male; married is one if the individual is married; health is one if the individual reports to be in good health; educ is 0 if the person has no education, 1 if he/she achieved middle school diploma, 2 for the high school diploma, 3 for the bachelor degree, 4 for the master degree and 5 for the PhD; age is in years and age2 is the square of age.

We estimate two models:

$$Pr(ins = 1|X) = \beta_0 + \beta_1 \times selfemp + \beta_2 \times married + \beta_3 \times gender + \beta_4 \times health + \beta_5 \times gender * health + \beta_6 \times educ + \beta_7 \times age + \beta_8 \times age^2$$

Coefficients:

| | Estimate Std. Error t | | value | Pr(> t) | |
|---------------|-----------------------|-----------|--------|-----------|--|
| (Intercept) | 0.2974634 | 0.0580248 | 5.13 | 0.0000003 | |
| selfemp | -0.1742361 | 0.0141740 | -12.29 | < 2e-16 | |
| married | 0.1181062 | 0.0094187 | 12.54 | < 2e-16 | |
| gender | -0.0232270 | 0.0343575 | -0.68 | 0.49903 | |
| health | 0.0744310 | 0.0247243 | 3.01 | 0.00262 | |
| genderxhealth | -0.0206248 | 0.0353131 | -0.58 | 0.55920 | |
| educ | 0.0529807 | 0.0029210 | 18.14 | < 2e-16 | |
| age | 0.0105315 | 0.0027482 | 3.83 | 0.00013 | |
| age2 | -0.0000788 | 0.0000333 | -2.37 | 0.01796 | |
| | | | | | |

Heteroskadasticity robust standard errors used

$$Pr(ins = 1|X) = \Phi(\beta_0 + \beta_1 \times selfemp + \beta_2 \times married + \beta_3 \times gender + \beta_4 \times health + \beta_5 \times gender * health + \beta_6 \times educ + \beta_7 \times age + \beta_8 \times age^2)$$
 (II)

Coefficients:

| | Estimate | Std. Error | z value | Pr(> z) |
|---------------|-----------|------------|---------|----------|
| (Intercept) | -0.844932 | 0.195991 | -4.31 | 0.000016 |
| selfemp | -0.651923 | 0.046842 | -13.92 | < 2e-16 |
| married | 0.455241 | 0.034845 | 13.06 | < 2e-16 |
| gender | -0.040238 | 0.111653 | -0.36 | 0.71856 |
| health | 0.300503 | 0.082988 | 3.62 | 0.00029 |
| genderxhealth | -0.124880 | 0.116613 | -1.07 | 0.28422 |
| education | 0.226139 | 0.012852 | 17.60 | < 2e-16 |
| age | 0.029150 | 0.009899 | 2.94 | 0.00323 |
| age2 | -0.000162 | 0.000126 | -1.29 | 0.19821 |

Question 9 How do you interpret the intercept under model (I)?

- A It is the average probability of having an insurance in our sample.
- B It does not have a real meaning in this case.
- The interest of the probability to have an insurance for a female, not self employed, non-married, with a bad health status, no education and with age equal to 0.
- D It is the probability to have an insurance for a male, not self employed, non-married, with a bad health status, no education and with age equal to 0.

Question 10 Is being self employed significantly linked to having an insurance under model (II)?

- A Yes, since the model includes the variable "selfemp".
- B It depends on the values of all other covariates.
- $\boxed{\mathbf{C}}$ No, since the coefficient β_1 is not significant.
- \square Yes, since the coefficient β_1 is significant.

Question 11 Does increasing level of education have a significant impact on the probability to buy an insurance at 5% level under model (I)?

- \overline{A} No, since the coefficient β_6 is not significant.
- B Yes, since the coefficient β_6 is significant.
- C It depends on the values of all other covariates.
- D Yes, since the model includes the variable "educ".

Question 12 Does increasing level of education have a significant impact on the probability to buy an insurance at 5% level under model (II)?

- A Yes, since the model includes the variable "educ".
- B No, since the coefficient β_6 is not significant.
- C Yes, since the coefficient β_6 is significant.
- D It depends on the values of all other covariates.

Question 13 . Under model (I), which of the following statements are true?

- A higher education is associated, on average, with an higher probability of having an insurance, ceteris paribus.
- B If the person is a female, the effect of good health on the probability to have an insurance is $\beta_4 + \beta_5$.
- C We cannot interpret the estimated coefficients in terms of magnitude.
- D Statistically speaking, having a good health has the same impact on the probability of having an insurance for male and female, holding other factors constant.
- E None of these answers are correct.

Question 14 • Under model (I), which of the following statements are true?

- A On average, self employed people are less likely to have an insurance, controlling for all other factors.
- B The older an individual grows, the higher the probability of having an insurance.
- The probability of having an insurance is linked to age in a linear fashion.
- D Statistically speaking, having a good health has the same impact on the probability of having an insurance for men and women.
- | E | None of these answers are correct.

Question 15 In model (I) we used heteroskedastic-robust standard errors. Could have we used homoskedastic standard errors instead?

- A Only if we knew that the errors were in facts homoskedastic.
- B No, because the errors are very likely to autocorrelated.
- C No, because homoskedasticity rarely occurs in nature.
- D No, because homoskedasticity is not possible when the dependent variable is a dummy.

Question 16 What is the estimated probability that a 24 years old non-educated non-self-employed single female who is not in good health and with middle school diploma will buy insurance coverage?

- A Less than 5%.
- B Approximately 0.5.
- C I cannot say because the model is nonlinear.
- D More than 95%.
